

How to run

LIVE

sound

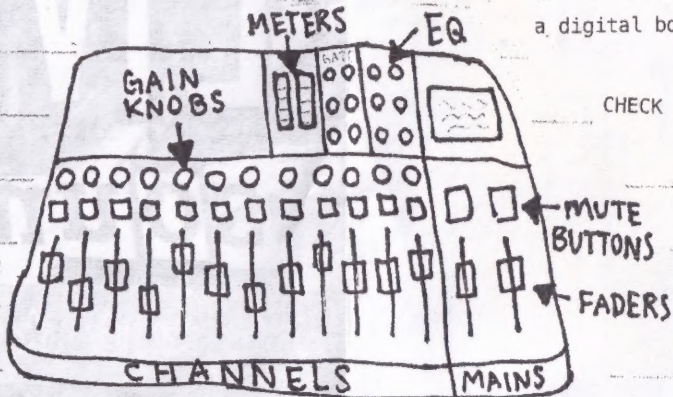

Today's Lesson

Here are the features that are discussed in this brief mini-zine.

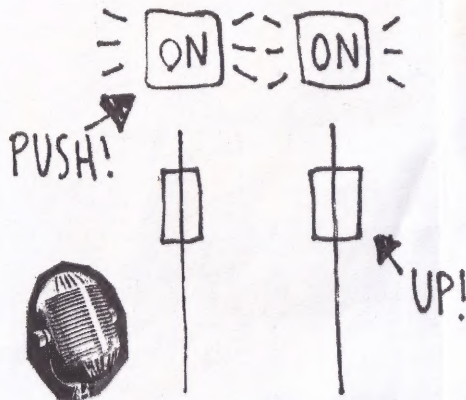

The placement of these things will vary from board to board.

This is the basic layout of a Soundcraft Si Expression, which is a digital board.

CHECK IT.

- After everything is plugged in, **unmute** the channels that you want to check, then turn up the main faders so the crowd can hear.

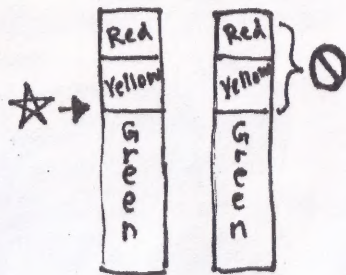

Turn up the **gain** on the channel you're testing until the signal is green, and almost hitting yellow/red.

avoid clipping!

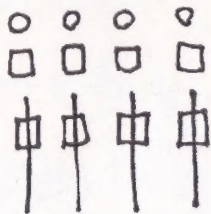

METERS

Push up the faders on the channels

until everything is at
an equal volume.

Aim for unity

Sounds Great!

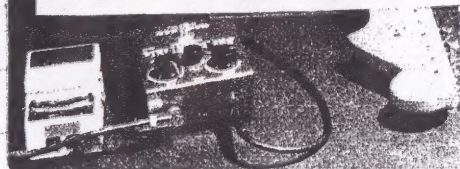

Feel free to adjust the EQ to

change the tone (boost/reduce treble,
mids, and bass) or try to get rid

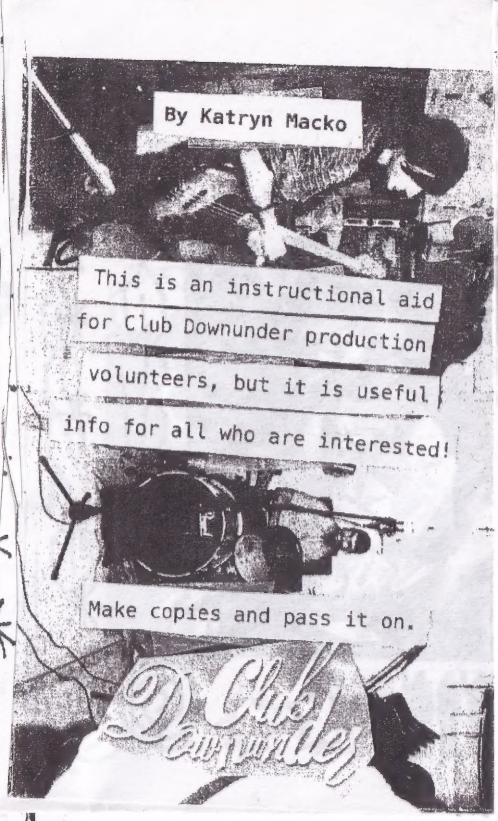

of feedback. The best way to prevent

feedback is to keep the gain low.

Walk around the room to hear what the audience hears. If something
sounds too quiet, loud, boomy, etc. feel free to fix it!
